HCV

HCV Cycles

One cycle of the hCV include an HCV open and an HCV close. An HCV open is defined by completing at least 50 positive raw hall counts by monitoring the mnemominc HCV1_HALL_POSITION_COUNTS. An HCV close is counted when the HCV changes by at leat 100 negative counts.

In the event that the HCV is left open when a TID ends, the algorithm should assume the HCV is in the state the previous TID left it.
