## Name Conventions Reference

Structs definition names have certain requirements and optional conventions, unless otherwise indicated.

Names are limited to 128 characters and may not include the following reserved characters:

- & (ampersand)
- ! (excalamation point)
- ? (question mark)
- \$ (dollar sign)
- : (colon)
- ; (semicolon)
- # (number symbol)
- \* (asteriks)
- @ (at symbol)
- , (comma)
- ( (open parentheses)
- (close parentheses)
- { (open brace)
- } (close brace)

In cases where names are used by API actions to lookup definitions, the @ character may be used to indicate an external ID instead of a plain name.

For matching purposes names are **case insensitive** and **normalized** with any leading/trailing whitespace removed and any internal whitespace represented by a single underscore character. For example:

```
"v_mon" = "V Mon" = " V MON "
```

XINA tools will interpret the period character (.) to indicate a tree structure relationship, and brackets ([]) to indicate an array of values. This is entirely presentational, not functional.

For example, the set of names:

foo.bar
foo.baz.bit
foo.arr[0]
foo.arr[1]
foo.arr[2]

Would be displayed as:

arr[0]arr[1]arr[2]

This is not required but highly recommended to improve organization in large namespaces.
